1.0 VESSEL DESCRIPTION

Armstrong VA/VAS Vortex Air Separators eliminate air quickly and efficiently from heating/cooling systems. Water enters and exits through unique **tangential** connections which promote a low velocity swirling effect in the centre of the unit. Centrifugal force moves the water to the outer edges of the unit and a vortex is formed. Entrained air migrates to the eye of the vortex (lower pressure point) and is evacuated at the top of the separator. The water exits the unit near the bottom of the unit, bubble free, protecting the system against the noise, corrosion and damage associated with entrained air.

VAS models are equipped with a stainless steel strainer.
